I'm going to send a couple of layers.  
First off, here is what USFWS declared is official pine rockland in urban Miami.

Subject: Mapping question

Hi Jenn!!

Hope you had a wonderful and relaxing Turkey day! First, I am almost, nearly done with Ben/Emily revisions on the paper from my Master's (which you will be on) so I will send that over soon for you to review (Woot Woot!). Second, stranger question, do you have a GIS layer for pine rockland historical and current extent? I have a vague memory of you mentioning you have one. If so, would you mind if I used it to build a map for the paper? I think I've been co-opting the IRC's map for long enough.

Also, that biogeography of endemic species in the Caribbean paper was too cool, and definitely in the realm of what I'm think about moving forward. Thanks again for sending it along!

Thanks so much!

Best,  
Lauren

This layer includes rockland hammock fragments. It should be noted that the "original extent" layer I sent was really pine rockland PLUS hammock, unless you go in and cut out all the hammocks.

This file was generated by Keith Bradley from IRC, under contract to Miami-Dade EEL, and using some old data from Fairchild and elsewhere too probably.

That's all for now. I hope that helps!! Yes, please use away, just please credit IRC, Fairchild, EEL, and USFWS where relevant.

Big congratulations on getting your master's mostly published!!! I can't wait to see it. 😊

I'm buddies with one of the authors of that Caribbean paper (Julissa Roncal), so if you want an email introduction just let me know.

Happy belated Thanksgiving to you, too,

Jenn
